

Factorial Functional carriage on a redundant two-route task

The target is locally sufficient, while dense attention can also retrieve it by a semantic-structural distant lookup

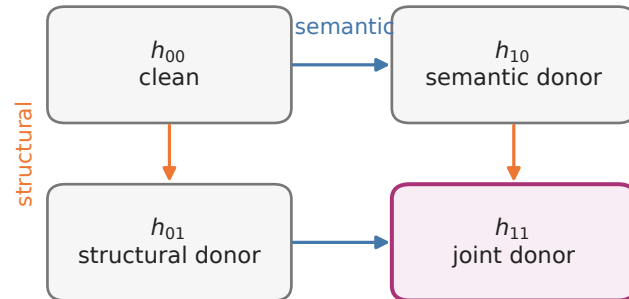

a

Two correct routes

b

One factorial extension

$$I_{v,h} = |\langle h_{00} - h_{10} - h_{01} + h_{11}, \nabla_h f \rangle|$$

aggregate raw interaction mass by carrier distance

c

Three separate conclusions

Local-only refit = 0
distant route is not task-necessary

Interaction mass increases
conjunctive distant route is instantiated

Rescue and damage increase
backup capacity and matching exposure

Usage and reliance are measured; necessity is tested separately.
